sellify Automation Server

Automate tasks, design workflows

Description

With the sellify Automation Server, administrators and authorized users can define actions that are executed automatically. This includes, among other things, the automatic generation of result lists in the form of Excel files from the find function, which can either be archived in sellify, stored on network drives or delivered to specific individuals by e-mail.

Furthermore, sellify's inbox processing enables intelligent processing of incoming e-mails and letter mail. Here, e-mails and documents are automatically assigned to the corresponding sender in sellify, the appropriate document type is determined, and context-related follow-up tasks with due dates are created and assigned to the correct clerks. Combined with the sellify group worklist, this results in an efficient inbox solution that significantly increases productivity and work quality.

In addition, List&Label reports can be automatically archived in sellify, stored on network drives, or delivered to specific individuals via email. The automatic execution of programs is also among the possible actions that can be automated by the sellify Automation Server.

Installation & configuration

sellify Automation Server is licensed once. You can define the configuration of the automatisms required for your business processes yourself.
